

## 7:1 Genetics

### Gregor Mendel:

- Austrian monk
- Studied the inheritance of traits in pea plants
- His work was not recognized until the 20<sup>th</sup> century
- Between 1856 and 1863, Mendel cultivated and tested some 28,000 pea plants
- Found that plants offspring retained traits of the parents
- Considered the “Father of Genetics”

You are who you are due to the interaction of **HEREDITY** and **ENVIRONMENT**.

ENVIRONMENT: all outside forces that act on an organism.

HEREDITY: traits that are passed from parents to offspring.

GENETICS: the scientific study of heredity.

## 7:2 Types of Genetic Crosses

MONOHYBRID CROSS: cross analyzing the probability a inheriting a single trait

ALLELE: one half of a gene, comes from either the mother or the father.

Alleles may be symbolized by using capital or lower case letters.

T → allele for tall stem trait

t → allele for short stem trait

GENOTYPE: symbols representing the alleles present in a gene in the cells of an organism. **EX**: TT, Tt, tt

PHENOTYPE: the trait caused by a gene; what you can see. **EX**: Tall plant, short plant

DOMINANT ALLELE: allele whose trait is expressed

RECESSIVE ALLELE: allele whose trait is not express because it is overruled by the dominant allele

HOMOZYGOUS: genotype in which both alleles of a gene are the same. **EX**: TT → homozygous dominant  
tt → homozygous recessive

HETEROZYGOUS: genotype in which the two alleles of a gene are different; hybrid. **EX**: Tt → heterozygous

### TO MAKE A PUNNETT SQUARE

1. Draw a square and select a trait to study.

- List alleles for all possible male gametes across top of the square.
- List alleles for all possible female gametes down the side of the square.
- Fill in the square by placing one female gamete and one male gamete in each square.

### How to Make a Punnett Square

Punnett squares allow geneticists to predict the possible genotypes and phenotypes of offspring.

In this example, both parents are heterozygous for yellow-pea allele (Yy).

**1 Make the grid**  
Place the alleles of the gametes of one parent along the top of a grid and those of the other parent along the left-hand side.

**2 Fill in the grid**  
Combine the parent alleles inside the boxes. The letters show the genotypes of the offspring.

The genotype ratio is 1:2:1, meaning 1 YY, 2 Yy, 1 yy.

**3 Fill in the offspring**  
Use the Law of Dominance to determine the phenotypes and phenotype ratio of the offspring.

The phenotype ratio is 3:1, meaning 3 yellow peas to 1 green pea.

These show the 2 alleles of each parent plant crossed with each other and the resulting 4 possible offspring with T = tall, t = short.

TT = dominant tall, tt = recessive short, Tt = mixed hybrid

TT = dominant tall (genotype tall, phenotype tall)

Tt = mixed hybrid (genotype hybrid, phenotype tall)

tt = recessive short (genotype short, phenotype short)

Using the Punnett's Squares below, name the offspring of all possible parent combinations.

Both parents are dominant tall, name the 4 possible offspring.

- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_

Both parents are mixed hybrids, name the 4 possible offspring and the expected ratio.

- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_

One parent is dominant tall, one is mixed hybrid, name the 4 possible offspring.

- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_

Both parents are recessive short, name the 4 possible offspring.

- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_

## 7:3 What did Mendel do?

### MENDEL USED PEA PLANTS TO STUDY HEREDITY FOR TWO REASONS

1. He could easily identify 7 different characteristics and two opposing traits for each characteristic.

**CHARACTERISTIC:** a hereditary quality of an organism.

**EX:** stem length, seed color

**TRAIT:** contrasting or opposing forms of a characteristic that can be passed passed from parent to offspring .

**EX:** tall stem or short stem  
yellow seed or green seed

| Character    | Dominant trait  | Recessive trait  | Character       | Dominant trait  | Recessive trait  |
|--------------|---|--|-----------------|---|--|
| Seed shape   | <br>Spherical  | <br>Wrinkled      | Flower position | <br>Axial | <br>Terminal |
| Seed color   | <br>Yellow    | <br>Green        |                 | Stem height   | <br>Tall      |
| Flower color | <br>Purple   | <br>White       |                 |   |  |
| Pod shape    | <br>Inflated | <br>Constricted |                 |   |  |
| Pod color    | <br>Green    | <br>Yellow      |                 |   |  |

2. He could control the fertilization of pea plants, because each plant has both male and female reproductive organs.

**SELF-POLLINATION:** when pollen (sperm) from a plant fertilizes an egg on the same plant.

**CROSS-POLLINATION:** when pollen from one plant fertilizes an egg on another plant.

- Mendel hand-pollinated flowers using a paintbrush.
- He could snip the anther and stamens (male parts) to prevent self-pollination or cross-pollination
- Covered each flower with a cloth bag, to control the pollination

### MENDEL WAS SUCCESSFUL BECAUSE:

1. He studied only one characteristic at a time.
1. He kept detailed quantitative records of his work.

## 7:4 Mendel's Experiments

### Three Steps of Mendel's Experiments

Step One: Mendel observed self pollination in peas plants.

TRUE-BREEDING: organisms that always produce a specific trait when they self-pollinate ( $P_1$  generation)

PARENTAL ( $P_1$ ) GENERATION: parents with two different traits.

**RESULTS:** Plants kept the same traits generation after generation.

**EX:** Tall plants always produce tall offspring when self-pollinating, short always produce short.

**Step Two:** Mendel cross-pollinated plants with contrasting traits.

**FIRST FILIAL (F<sub>1</sub>) GENERATION:** offspring of the P<sub>1</sub> parents, have only one of the two parental traits.

**RESULTS:** All of the F<sub>1</sub> offspring exhibited the same trait, they looked like only one of the parents.

**EX:** P<sub>1</sub> Tall X Short  
F<sub>1</sub> ALL Tall

**Step Three:** Mendel allowed the F<sub>1</sub> generation to self-pollinate.

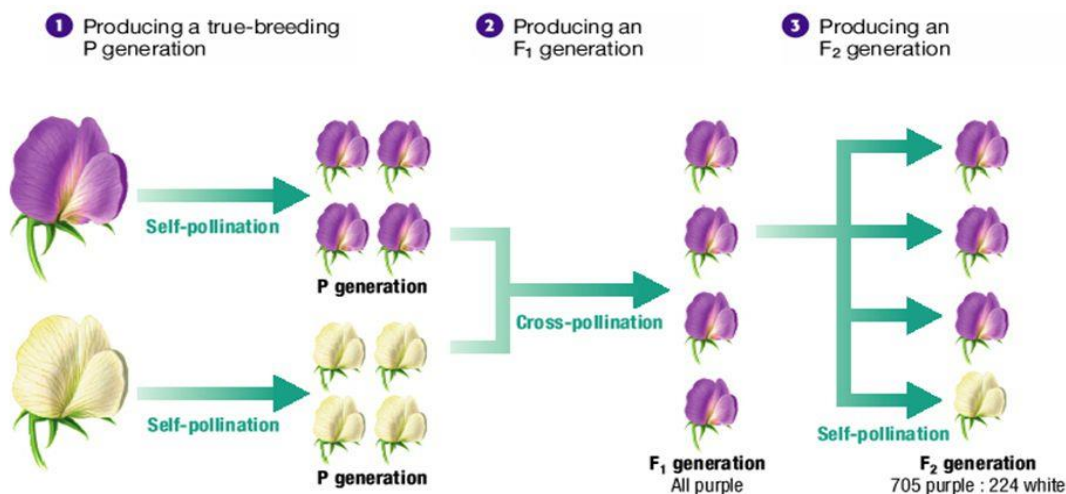

**SECOND FILIAL (F<sub>2</sub>):** offspring of the F<sub>1</sub> generation.

**RESULTS:** In the F<sub>2</sub> generation ¾ had one trait, ¼ had the contrasting trait.

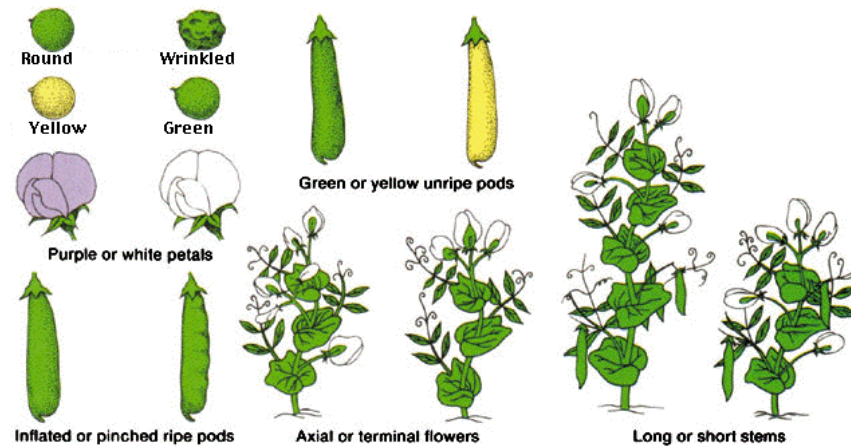

**EX:** P<sub>1</sub> tall X short  
F<sub>1</sub> All tall  
F<sub>2</sub> ¾ tall and ¼ short

### Three Steps of Mendel's Experiments

The trait on the left is dominant and the trait on the right is recessive

## Results of Mendel's Monohybrid Crosses

| Characteristics | P <sub>1</sub> Contrasting Traits | F <sub>1</sub> Results | F <sub>2</sub> Results          | Observed F <sub>2</sub> Ratio |
|-----------------|-----------------------------------|------------------------|---------------------------------|-------------------------------|
| Seed Shape      | Round X wrinkled seed             | Round                  | 5474 Round<br>1850 wrinkled     | 2.96:1                        |
| Seed Color      | Yellow X green seed               | Yellow                 | 6022 Yellow<br>2001 green       | 3.02:1                        |
| Flower Color    | Purple X white flower             | Purple                 | 705 Purple<br>224 white         | 3.15:1                        |
| Pod Shape       | Inflated X constricted pod        | Inflated               | 882 Inflated<br>299 constricted | 2.95:1                        |
| Pod Color       | Green X yellow pod color          | Green                  | 428 Green<br>152 yellow         | 2:82:1                        |
| Flower Position | Axial X terminal flower           | Axial                  | 651 Axial<br>207 terminal       | 3.14:1                        |
| Stem Height     | Tall X short                      | Tall                   | 787 Tall<br>277 short           | 2.84:1                        |

PROBABILITY: likelihood that a specific event will occur

$$\text{Probability} = \frac{\text{\# of times an event is expected to happen}}{\text{\# of times an event could happen}}$$

We use Punnett squares to determine the probability, or theoretical ratio.

## Example:

- Theoretical ratio of plants producing round seeds to wrinkled seeds is 3:1
- Mendel's observed ratio was 2.96:1
- Statistical Error accounts for the difference between theoretical and observed ratios
- The larger the sample, the more the theoretical and observed ratios are the same.

## Conclusion of the result in the above table:

- The heterozygous  $F_1$  generation expresses the dominant trait.
- In the  $F_2$  generation, offspring may express either the dominant or the recessive trait.
- In the  $F_2$  generation, the dominant to recessive ratio is 3:1 (75% dominant, 25% recessive).

## 7:5 Mendel's Laws

1. Genes Determine Characteristics: Inherited characteristics (traits) are determined by genes, genes consist of two alleles (1 gene = 2 alleles).

GENE: unit of heredity which determines the trait expressed for a characteristic, enough DNA to code for one protein.

ALLELE: one half of a gene, comes from either the mother or the father.

ALLELE from mom + ALLELE from dad = GENE of offspring

2. Law of Dominance: One allele of the pair of a gene may mask the other allele, preventing it from expressing its effect.

DOMINANT ALLELE: allele whose trait is expressed

RECESSIVE ALLELE: allele whose trait is not expressed because it is overruled by the dominant allele

EX: Tall allele is dominant T  
Short allele is recessive t

| <u>GENE</u> |             | <u>TRAIT</u> |
|-------------|-------------|--------------|
| TT          | pure tall   | Tall         |
| tt          | pure short  | short        |
| Tt          | hybrid tall | Tall         |

HYBRID: an organism that expresses the dominant trait, but carries both the dominant and recessive allele.

3. Law of Segregation: The alleles in the pair of a gene are separated during formation of gametes (egg or sperm).

GAMETES: haploid reproductive sex cells, have only one allele of each gene.

EX: pure tall plant (TT) → all gametes have tall allele (T)  
pure short plant (tt) → all gametes have short allele (t)  
hybrid tall plant (Tt) → ½ gametes have tall allele (T)  
½ gametes have short allele (t)

4. Law of Independent Assortment: The allele pair of one gene is separated and distributed to gametes (egg & sperm) independently of all other genes.

EX: alleles for height gene have no connection with alleles for the seed color gene →

Parent gene → TtYy  
Possible gametes → TY, Ty, tY, ty

## 7:6 Dihybrid Crosses

DIHYBRID CROSS: cross analyzing the probability of inheriting two traits at the same time

### Practice Making Gametes (Independent Assortment)

What are the possible gametes this parent can make?

- Homozygous Round Yellow (RRYY)

- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_

What are the possible gametes this parent can make?

- Homozygous Wrinkled Gametes (rryy)

- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_

So, what will be the result of all the gametes? \_\_\_\_\_

What are the possible gametes this parent can make?

- Heterozygous Round Smooth (RrSs)

- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_

Complete a dihybrid cross for TWO parents that are RrSs.

|  |  |  |  |  |
|--|--|--|--|--|
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |

What are the results?

---

---

---

---

A heterozygous dihybrid cross is a \_\_\_\_\_  
ratio in offspring.

## 7:7 Incomplete Dominance and Codominance

**INCOMPLETE DOMINANCE:** when neither allele of a gene is dominant and both affect the phenotype.

**EX:** Four-o'clock flowers

Characteristic – flower color

R=allele for red color

W=allele for white color

| Genotypes | Phenotypes |
|-----------|------------|
| RR        | Red        |
| RW        | Pink       |
| WW        | White      |

⇒ Cross a red flower plant with a white flower plant.

|   |    |    |
|---|----|----|
|   | R  | R  |
| W | RW | RW |
| W | RW | RW |

All offspring are heterozygous (RW) and have the **PINK** flower color trait.

⇒ Cross two of the heterozygous pink.

|   |    |    |
|---|----|----|
|   | R  | W  |
| R | RR | RW |
| W | RW | WW |

|           |      |            |         |
|-----------|------|------------|---------|
| Genotype: | 1 RR | Phenotype: | 1 Red   |
|           | 2 RW |            | 2 Pink  |
|           | 1 WW |            | 1 White |

CODOMINANCE: occurs when both alleles for a gene are expressed in a heterozygous offspring

- Both traits are expressed at the same time, no blending

Example: blood type is the codominance or combination of your parent's blood type

1. Type A =  $I^A I^A$  or  $I^A i$

2. Type B =  $I^B I^B$  or  $I^B i$

3. Type AB =  $I^A I^B$

4. Type O =  $ii$

Monohybrid Cross:

Homozygous Male Type B ( $I^B I^B$ ) x Heterozygous Female Type A ( $I^A i$ )

|  |  |
|--|--|
|  |  |
|  |  |

Heterozygous Male Type AB ( $I^A I^B$ ) x Female Type O ( $ii$ )

|  |  |
|--|--|
|  |  |
|  |  |

## 7:8 Sex-Linked Traits, Polygenic Traits, Single-Allele Traits, and Epistasis

**SEX-LINKED TRAIT:** a trait that is determined by a gene found on one of the sex chromosomes, such as the X chromosome or the Y chromosome in humans

- Many sex-linked traits are carried on the X chromosome because the X chromosome is larger than the Y chromosome
- Examples: Male pattern baldness, Hemophilia, Red-Green Color Blindness, Muscular Dystrophy

People with Red-Green Blindness can see the second picture.

**POLYGENIC:** describes a characteristic that is influenced by many genes

- Examples: Skin color, Height, Hair Color, Body Shape, Eye Color

SINGLE-ALLELE TRAIT: traits that are expressed with only one allele

- Example: Huntington's Disease-autosomal dominant condition that causes forgetfulness, irritability, and muscle spasms

EPISTASIS: the interaction between two or more genes to control a single phenotype

- Example: Labrador retriever Coat Color, coat color is determined by two genes the E gene and B gene.
- Yellow fur → homozygous recessive ee
- Black or Chocolate fur → could be EE or Ee
  - Black → Could be BB or Bb because B is more pigmented
  - Chocolate → homozygous recessive bb

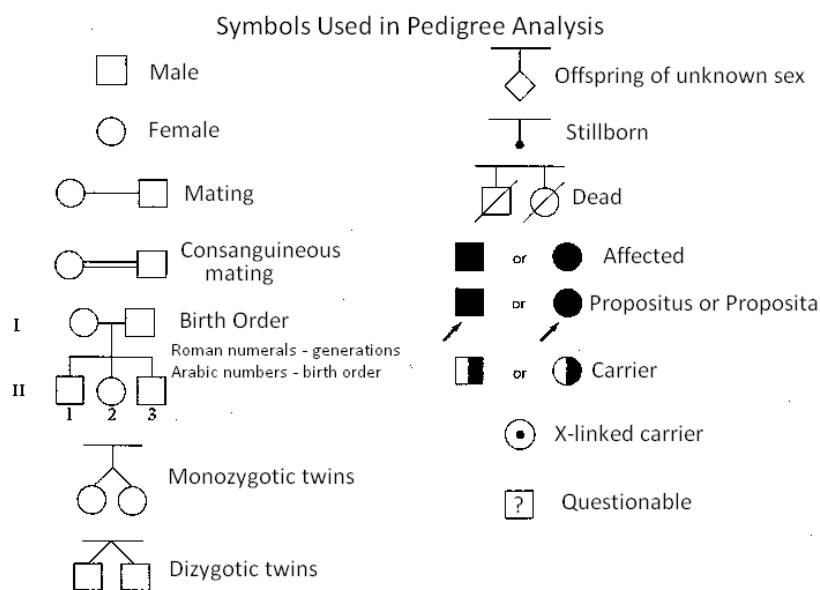

- **Example: Albinism in humans** → When the albino condition occurs, the genes that determine skin color are present but are not expressed

## 7:9 Pedigrees

**PEDIGREE**: family record that shows how a trait is inherited over several generations

**Pedigrees may be used for:**

- **Revealing CARRIERS**: a person who is heterozygous for a trait; usually used when referring to a genetic disease
- **Determining if a trait is dominant, recessive, or sex linked.**
- **Show the record of the family of an individual**

A marriage with five children, two daughters and three sons. The eldest son is affected by the condition.

Eldest child ↔ Youngest child

**Terms used in Pedigree Analysis:**

- **MONOZYGOTIC**: identical twins, arising from one egg and one sperm
- **DIZYGOTIC**: fraternal twins, arising from two eggs and two sperm

## Organizing the Pedigree Chart:

- Generations are identified by Roman Numerals
- Individuals in each generation are identified by numbers from left to right.
